

Hi team,

I am Akashdip, a person who love Open- Source. After reading the job description & online articles about this company I shocked. Genuinely I use Ubuntu from last 6 years, before my college life (Ubuntu, Kali, Fedora, Parrot, Garuda those are in my fav list, But for beginners Ubuntu (inbuilt Snap-Store, no random error like KAli) & Fedora (Red-hat base good to learning) is best choice. But because of most Mechanical Designing software are not supported, so I setup windows on Dual Boot; but Linux is my 1st choice always.

After reading the job description I feel freedom, it's no matter how much time you spent office, but the important thing is who much you work done. I feel very efficient work in my room. And it's my dream to join global events, meet new people, gain knowledge & enjoy.

I love Mathematics & Physics (Top 2% in mensa iq test 125 to 135 every time), love to learn new Tech. Love to discuss new ideas – Ex: how to make an infinite storage with quantum mechanics?

Currently I am working in a large enterprise Cloud base Data Pipelines (aws & infra focus), I already have good understanding on cloud (aws, Azure, GCP, Oracle & IBM cloud) After joining I immediate learn AWS, different CI/CD pipelines have different Event Driven Architecture, different privacy many more.

Now, my work is Automate all manual tasks for my DevOps team using Python Scripting, and if any problem/Alert triggers fix or support other senior engineers who have 10y+ experience. Most of senior engineers are join from UK, So when I planning to create something, or found a problem on an existing feature; meeting with those seniors, not only planning but also explain in front of all DEVOPS & PLATFORM team seniors how the automation works & taking feedback. The most problematic thing is explaining a technical thing in front of non-tech delivery managers for approval.

Get a job on Canonical is a dream come true, as a user who love Linux ecosystem. It's not only a job but a privilege. Whatever I learn all I documented in GitHub as an opensource (Ex - github.com/akashdip2001/NAS-with-ESP32). I am a very quick learner who love Linux & Technology.

So, I apply for those 2 jobs, I really want to work in this environment, and my Cloud/SRE/DevOps with leadership skills make me point out in team/group.

Thank You,
Akashdip Mahapatra .
