

Hi Oracle team,

I am Akashdip, a person who love Cloud Architecture and Automation. After reading the job description & online articles about Oracle's cloud and AI innovations I am excited. Genuinely I have a strong interest in OCI, and I already completed my Oracle Cloud Infrastructure 2024 Certified Foundations Associate. I explored many clouds (AWS, Azure, GCP), but the way Oracle handles enterprise data and infrastructure is the best choice for large scale problems.

After reading the job description I feel freedom, because the Solution Engineer role is exactly what I love to do. It's no matter how much time you spent in the office, but the important thing is how much work you done and how you solve customer problems. I feel very efficient building Proof of Concepts (POCs) in my room. And it's my dream to join global events, meet new people, gain knowledge & enjoy.

Currently I am working in a large enterprise Cloud base Data Pipelines (aws & infra focus), I already have good understanding on cloud (aws, Azure, GCP, Oracle & IBM cloud). Now, my work is Automate all manual tasks for my DevOps team using Python Scripting, and if any problem/Alert triggers fix or support other senior engineers who have 10y+ experience.

Most of senior engineers are join from UK, So when I planning to create something, or found a problem on an existing feature; meeting with those seniors, not only planning but also explain in front of all DEVOPS & PLATFORM team seniors how the automation works & taking feedback. The most important thing for this Oracle job is I regularly explaining a technical thing in front of non-tech delivery managers for approval. This is exactly what a Cloud Solution Engineer does when translating business needs to customers!

Get a job on Oracle is a dream come true, as a user who love enterprise cloud ecosystems. It's not only a job but a privilege. Whatever I learn all I documented in GitHub as an opensource. I am a very quick learner who love Cloud & Technology. So, I apply for this job, I really want to work in this environment, and my Python scripting, Cloud infrastructure, and leadership skills make me point out in team/group.

Thank You,

Akashdip Mahapatra.
