**Subject: Application for Solutions Architect II – Enterprise Professional Services
(India - Remote)**

Dear Akamai Hiring Team,

Most engineers believe enterprise cloud architecture is about monitoring dashboards, reacting to alerts, and following the manual. I build so I don't have to react. I am currently a Data Engineer focused on DevOps and AWS Automation at an enterprise scale, and I am applying for the Solutions Architect II role because Akamai's focus on Zero Trust deployment, proactive consulting, and high-level architecture perfectly aligns with how I already operate.

Your job description heavily emphasizes the ability to present intricate technical concepts to both technical and non-technical stakeholders. This is my absolute strongest asset. My foundation is actually in elite 3D mechanical design - I hold a National Award for drawing - and I weaponize that spatial awareness directly into cloud architecture. I don't just try to verbally explain REST APIs, OIDC authentication, or complex network routing to a room full of managers. I open a blank canvas in the middle of the meeting and live-draw the entire workflow. When you can instantly bridge the gap between deep backend mechanics like JWT tokens and high-level cloud infrastructure visually, you don't just solve the problem - you completely control the room. That is the exact consulting dynamic I will bring to your Enterprise Professional Services team.

Technically, my playground consists of AWS, Python, Docker, CI/CD (GitHub Actions), and Terraform. I recently architected an automated deployment validation system from scratch that completely replaced manual log-checking processes. Furthermore, because I have deep backend development experience, I don't just understand the cloud layer; I know exactly how the underlying software connects. It is incredibly common for senior infrastructure engineers to come to me when they need the underlying API interactions or identity logic explained.

I thrive in remote, highly distributed, asynchronous environments. I know how to navigate complex enterprise structures, manage stakeholder psychology, and protect the quality of my projects without ever getting bogged down in internal politics. I have zero interest in reactive L2 support; I want to architect the security frameworks, lead the technical workshops, and deploy the Proof of Concepts that drive the internet forward.

Akamai needs Solutions Architects who don't just know the networking protocols, but who know how to own the technical narrative and deliver bulletproof integrations. I would love to show you how my automation and communication strategies can scale your enterprise deployments.

Best regards,
Akashdip Mahapatra
