Rheinmetall Digital GmbH

Recruiting Team

Bremen, Germany

Subject: Application for DevOps Engineer (m/f/d) – Ref. No.: DE17371

Dear Hiring Manager,

I am writing to express my strong interest in the DevOps Engineer position at Rheinmetall Digital GmbH. With a deep background in managing high-throughput cloud infrastructure and a proven track record of reducing operational toil through infrastructure automation and DevSecOps practices, I am highly aligned with Rheinmetall's goal of building secure, reliable, and fully automated software delivery pipelines.

Currently, as an Engineer at Tata Consultancy Services (TCS) managing enterprise-scale infrastructure, I operate directly on the front lines of production reliability. I am responsible for ensuring the availability and performance of a high-throughput, event-driven AWS architecture processing 200 GB to 500 GB of IoT data daily. My day-to-day involves designing and maintaining automated CI/CD deployment lifecycles using **GitHub Actions, Docker, and Terraform**, ensuring that continuous delivery pipelines are robust, reproducible, and scalable.

Rheinmetall's emphasis on integrating automated security checks early in the development lifecycle resonates strongly with my core engineering philosophy. I continuously drive Root Cause Analysis (RCA) on Docker container vulnerabilities, patching critical CVEs to harden the architecture, ensure strict image immutability, and minimize downtime. Furthermore, to advance our self-service capabilities, I engineered a Python and Boto3-based automation script that completely replaced manual deployment validation checklists. This tool is now adopted by our entire 30-person cross-functional DevOps team, successfully reducing manual operational toil by **90%** and enforcing strict security and configuration baselines.

My foundation in Linux environments and networking was forged by troubleshooting deep OS issues using strace, tcpdump, and Wireshark. I have extensive experience hardening server security, deploying load balancers, and configuring strict network firewalls. Additionally, my degree in Mechanical Engineering fundamentally shaped my systems-thinking mindset, training me to view complex platforms as interconnected ecosystems where observability - driven by tools like Datadog and CloudWatch - is paramount.

I am highly collaborative, accustomed to working in English-speaking global engineering teams, and fully prepared to relocate to Bremen to contribute to Rheinmetall's mission. I would welcome the opportunity to discuss how my proactive approach to automation and platform engineering can strengthen your deployment infrastructure.

Thank you for your time and consideration.

Sincerely,

Akashdip Mahapatra
